Introduction

This document covers the post-flight analysis of MATeF-2 Test Mission. The main goal of the mission was to test the latest UPRA-ReHAB flight computer.

MATeF-2 and MATeF-3 (Konferencia II) flights were test to prepare the same service module for flights in short (less than 3 weeks) time period.

This flight report gives a summary of the mission: [Objectives](#), [Crew](#) and [Configuration](#), a detailed report of the flight events and the results of the [Post-Flight Analysis](#).

In the end of the document the [Lessons Learned](#) are gathered to improve the workflow and development for the upcoming test flights.

Detailed flight data can be found in *Appendix 1* to *Appendix 3*

1 Mission Summary

1.1 Mission Objectives

O_001	Target altitude: 16000m
O_002	Continuous telemetry downlink
O_003	Tracking via GPS: Latitude, Longitude, Altitude
O_004	Recovery
O_005	Module temperature measurement: OBC, COM
O_006	External temperature measurement
O_007	On-Board data logging
O_008	Backup Tracker test
O_009	Radio Uplink Test
O_010	APRS test

Table 1 Mission Objectives

1.2 Crew

Flight Director	Góczán Bence
Launch Director	Németh Márk
Technical Director	Góczán Bence
Launch staff	Tóth Raymond Ádám
Launch staff	Markos Péter
GND operator	Farkas Tamás
GND operator	Kiss Tamás
GND operator	Móna Dániel
Recovery Lead	Góczán Bence
Recovery staff	Bognár Márton
Recovery staff	Markos Péter
Recovery staff	Rév Balázs
Trajectory analysis	Várhegyi Zsolt

Table 2 Crew List

1.3 Mission Details

Launch Date	2018.03.31
Launch Time	10:26 UTC
Launch Site	N 47.473272, E 19.061722
Ground Station	BME Building Q
Ambient Temperature	17 -21 °C

Table 3 Mission details

1.4 Configuration

Flight System		
OBC	OBC.328	FW:2018_01_10_2129
COM	COM.RF69HCW	FW:2017_11_28_2308
EPS	EPS Proto	V2
GPS	uBlox NEO6M	baud: 9600
Backup	TK 102b GSM-GPS	GSM
Antenna	433MHz Groundplane	Yellow
Extras	External Temperature Sensor: MCP9700A	min: -50°C
	DRAPRS - APRS + VHF radio backup	DAPRS_tracker v3.3

Ground Station		
ASR	COM.RF69HCW	FW:2016_10_30_2006
MC	UPRA-PC + EZGND	EZ.2016_10_30_2013
Antenna	GND-Yagi	11 element ~+12dB

RECOVERY		
GND	COM.RF69CW	FW:2016_10_23_0030
SW	EZGND-Proto	EZ.2016_10_30_2013
Antenna	RECO-Yagi	6 element handheld
Extras	Vehicle	Skoda Octavia

Table 4 Flight system configuration

Primary Radio Downlink		Primary Radio Uplink	
Frequency	433.9MHz	Frequency	433.9MHz
Bitrate	1kbps	Bitrate	1kbps
Bandwidth	4kHz	Bandwidth	4kHz
Deviation	2kHz	Deviation	2kHz

Table 5 Primary (UHF) Radio Link

Secondary Radio Downlink (APRS)	
Frequency	144.8MHz
Bitrate	1200bps
Channel space	12.5kHz

Secondary Radio Uplink	
Frequency	-
Bitrate	-
Channel space	-

Table 6 Secondary (VHF) Radio Link

Balloon	Totex - TA200
---------	---------------

Probe	MATeF POC – Variant B
-------	-----------------------

Payload weight (with parachute)	760 gram
Dry Mass	960 gram

Table 7 Payload train

2 Launch Preparation

- Launch site preparation was successful
- System startup was successful
- Backup tracker was not operational at launch due to SIM activation delay
- APRS tracker was operational
- Radio link was established
- 3120 gram neck-lift was achieved

3 Flight

3.1 Controlled Flight I (Launch – 9300m)

- After Balloon Launch telemetry data was streamed properly
- Telemetry data was collected by primary GND
- APRS was operational

3.2 Controlled Flight II (9300m - Landing)

- Loss of Signal at primary GND
 - Balloon out of line of sight
 - Possible antenna problems on GND
- APRS was still operational
- Descent phase was longer than the simulated trajectory (see 4.5.1 *Descend analysis*)

3.3 Recovery

- Late start of the recovery team due to laptop problems
- GND relocation and extra equipment gathering for recovery
- APRS pinpointed the landing position
- Clear recovery

Balloon was ‘Recovered’

4 Post Flight Analysis

4.1 Objectives

O_001 - Target altitude: 16000m

Passed

To reach 16000m altitude with Totex 200g balloon 7 m/s ascent speed was calculated. 3120 gram neck lift was achieved during inflation which according to the telemetry data provided 7.37 m/s ascent rate was achieved. Balloon burst happened at 14957m altitude.

O_002 - Continuous telemetry downlink

Passed

We had continuous telemetry streamed by the balloon. The data was decoded during the controlled phase I.

O_003 - Tracking via GPS: Latitude, Longitude, Altitude

Passed

Live telemetry data was streamed on the website with live maps, altitude and housekeeping information.

O_004 – Recovery

Passed

Recovery was successful by APRS data.

O_005 - Module temperature measurement: OBC, COM

Passed

Module temperatures were transmitted and logged during the flight.

O_006 - External temperature measurement**Passed**

External temperature was transmitted and logged during the flight. Plausible data was received; fashion of the data matched the official reports of the local weather service.

O_007 - On-Board data logging**Passed**

Proper flight data was stored on the on-board SD card. Data logging was ended when the flight computer switched to 'Beacon' mode (see 5.4 *On-Board Data Logging*)

O_008 - Backup Tracker test**Failed**

Backup tracker SIM card was unregistered at launch, never tried to establish contact with the tracker.

O_009 - Radio Uplink Test**Partial Success**

Uplink was successful at low altitude. No answer at higher altitudes.

O_010 - APRS test**Passed**

APRS tracking was continuous during flight; landing site was pin-pointed.

4.2 Raw Telemetry Data

On-Board data in *Appendix 1*

GND data in *Appendix 2*

APRS data in *Appendix 3*

4.3 Altitude and Route

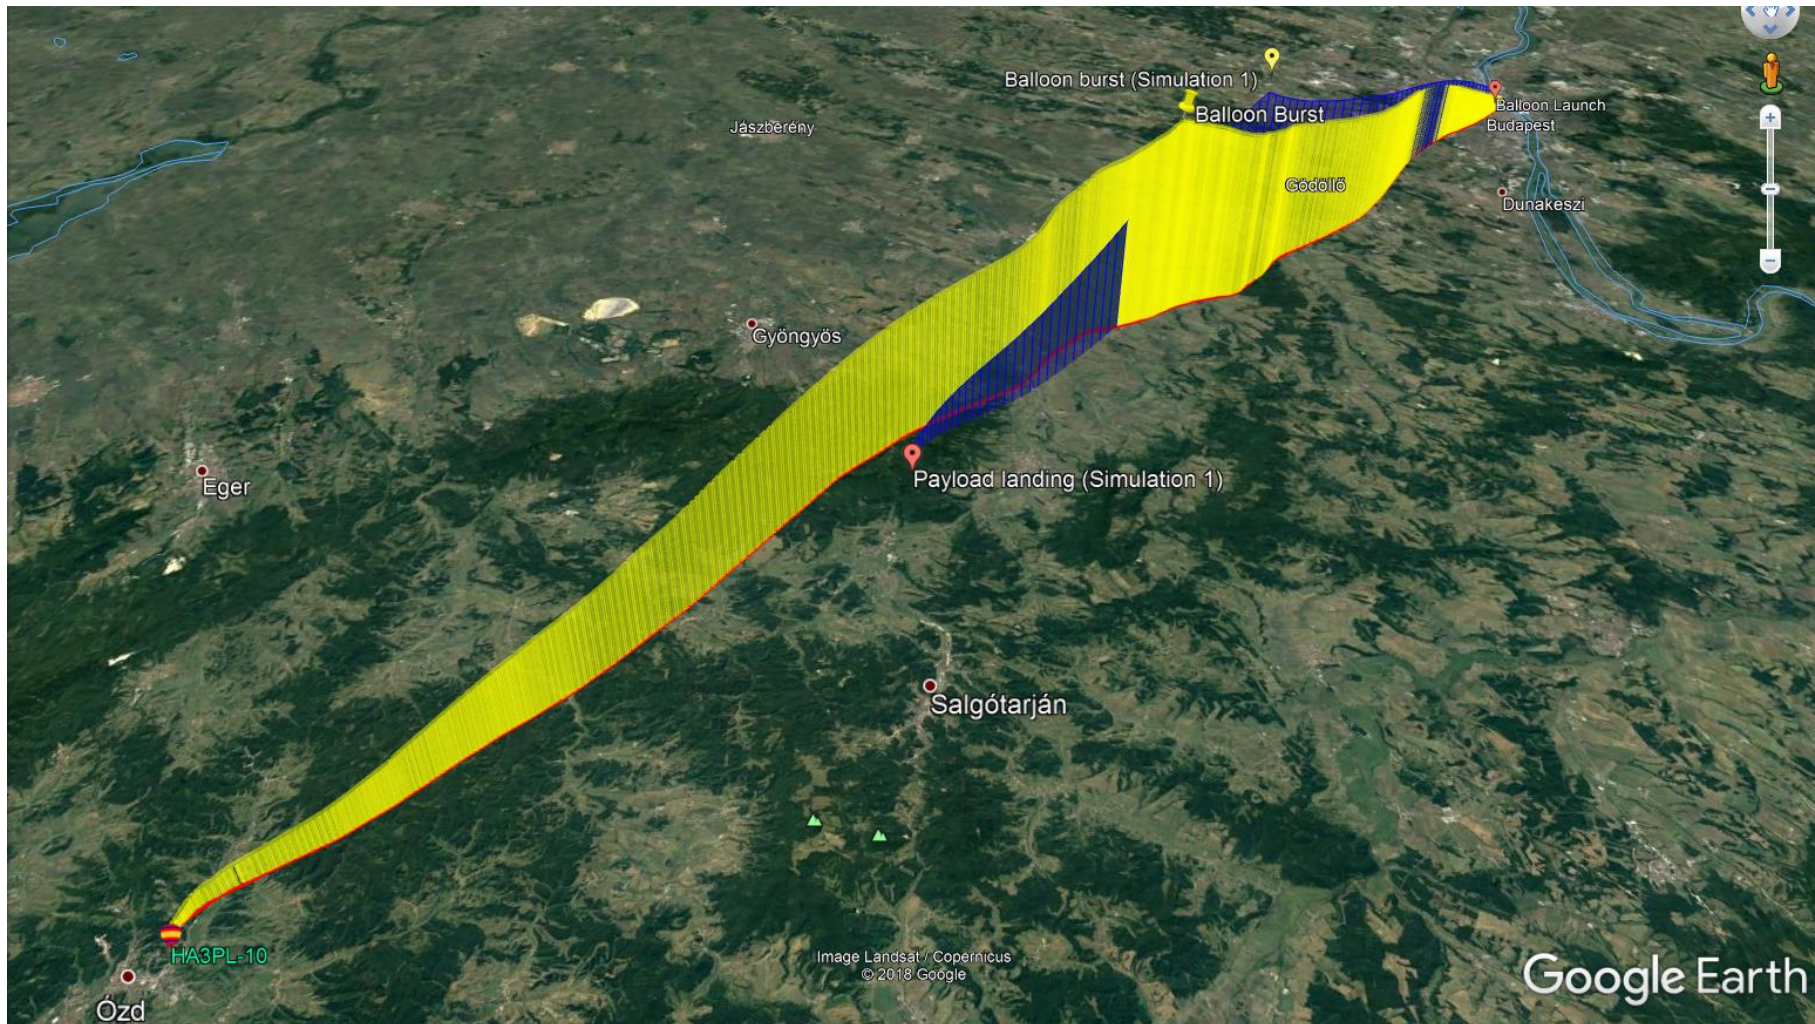

Figure 1 Yellow: On-Board Data | Red: APRS Data | Blue: Simulation

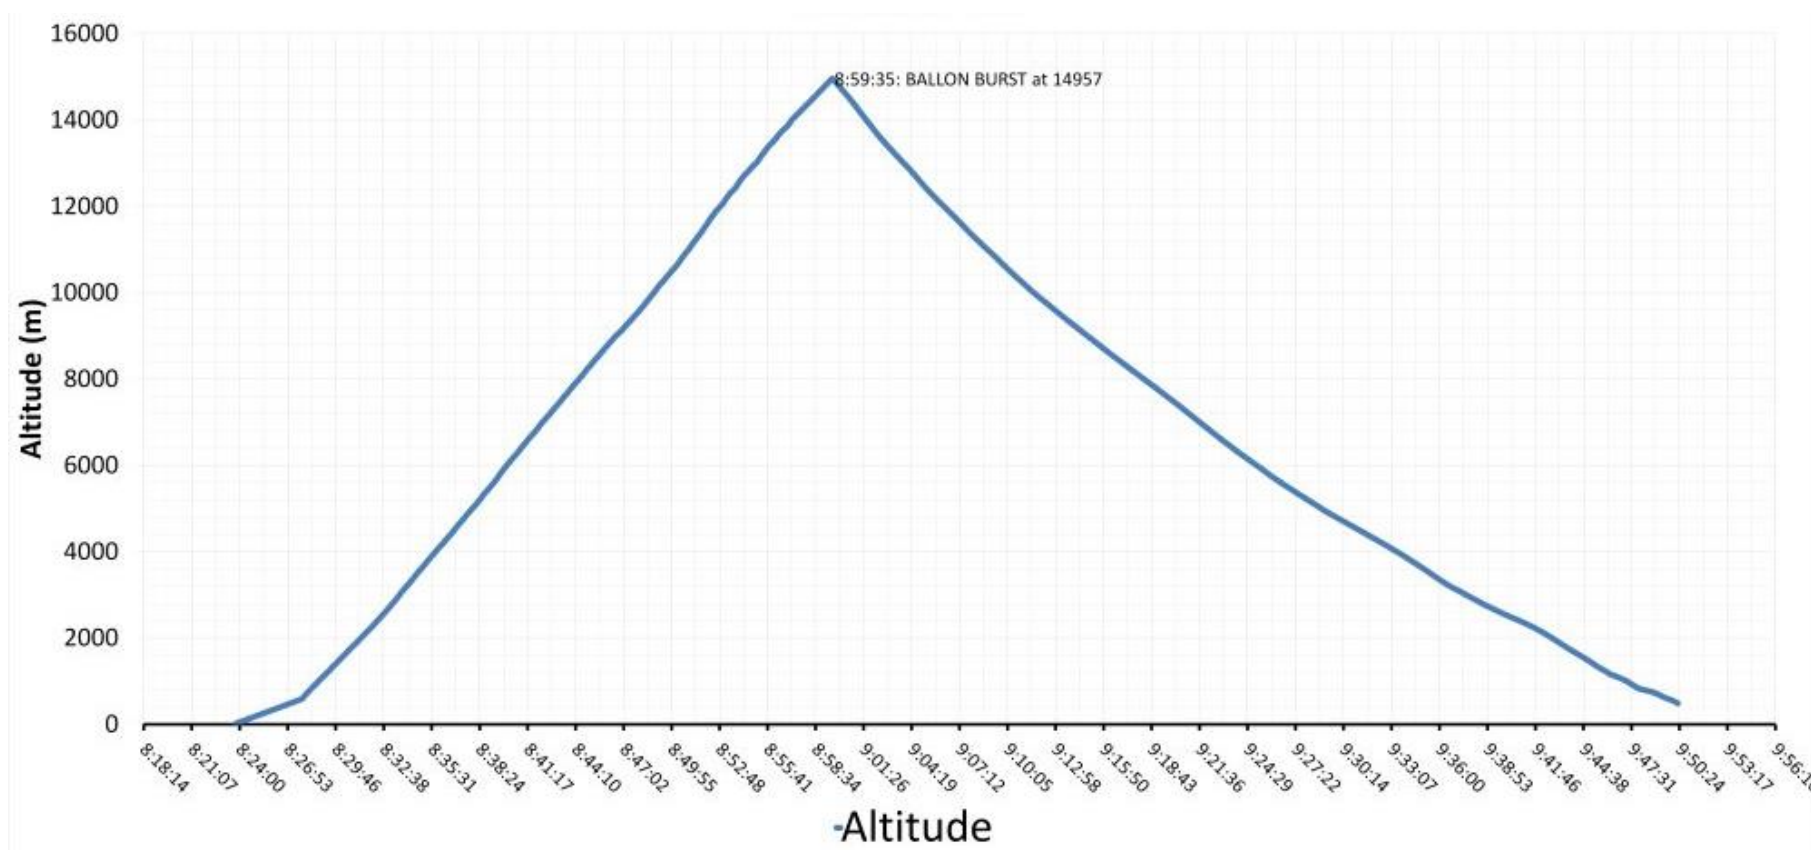

Figure 2 Altitude vs. Time

4.4 Temperature

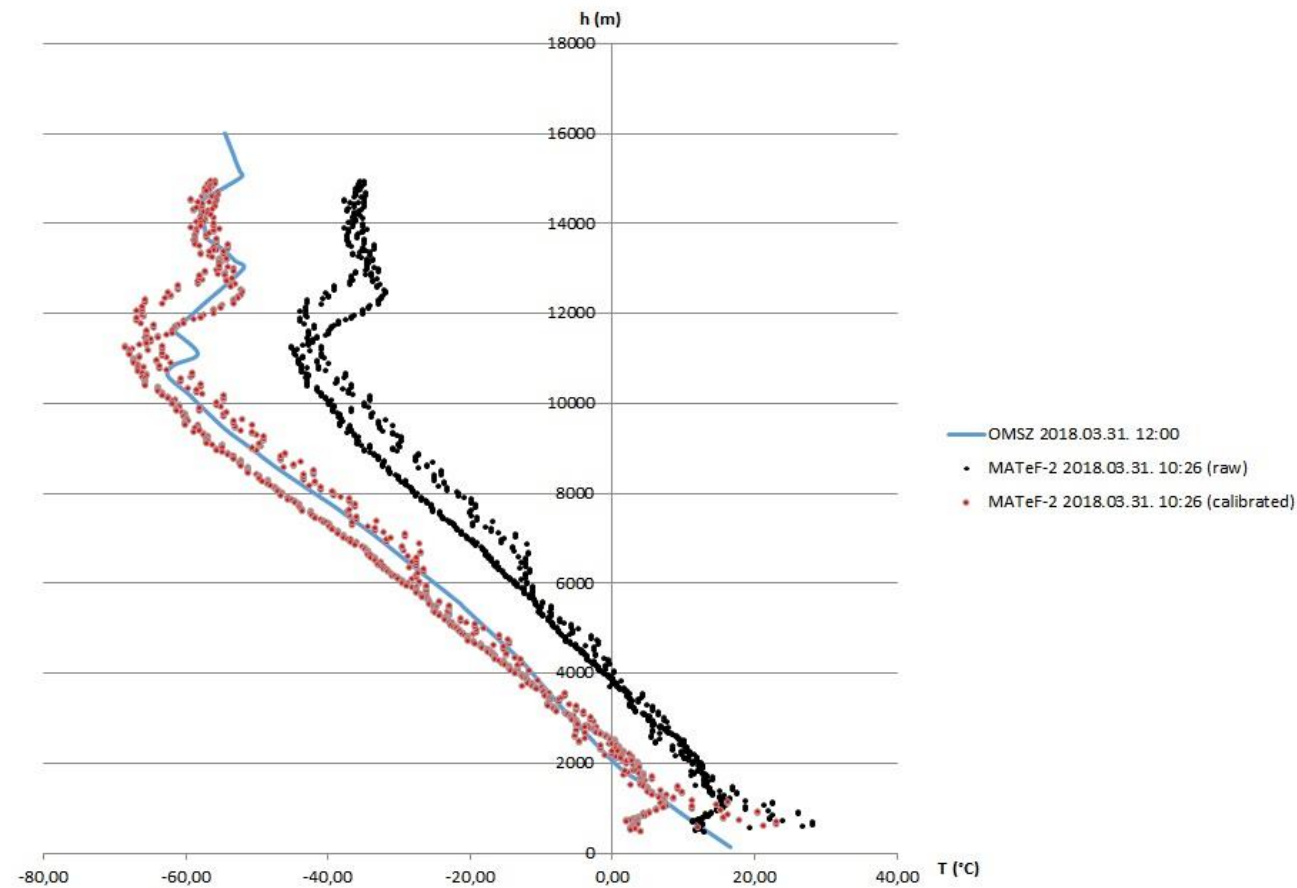

Figure 3 External Temperature

- Fashion of the external temperature data matched the official temperature data from the local weather service Z12 flight
- Post flight processing is needed on our temperature data to compensate self-heating effect of the sensor configuration (see 5.5 *External Temperature Sensor Placement*)

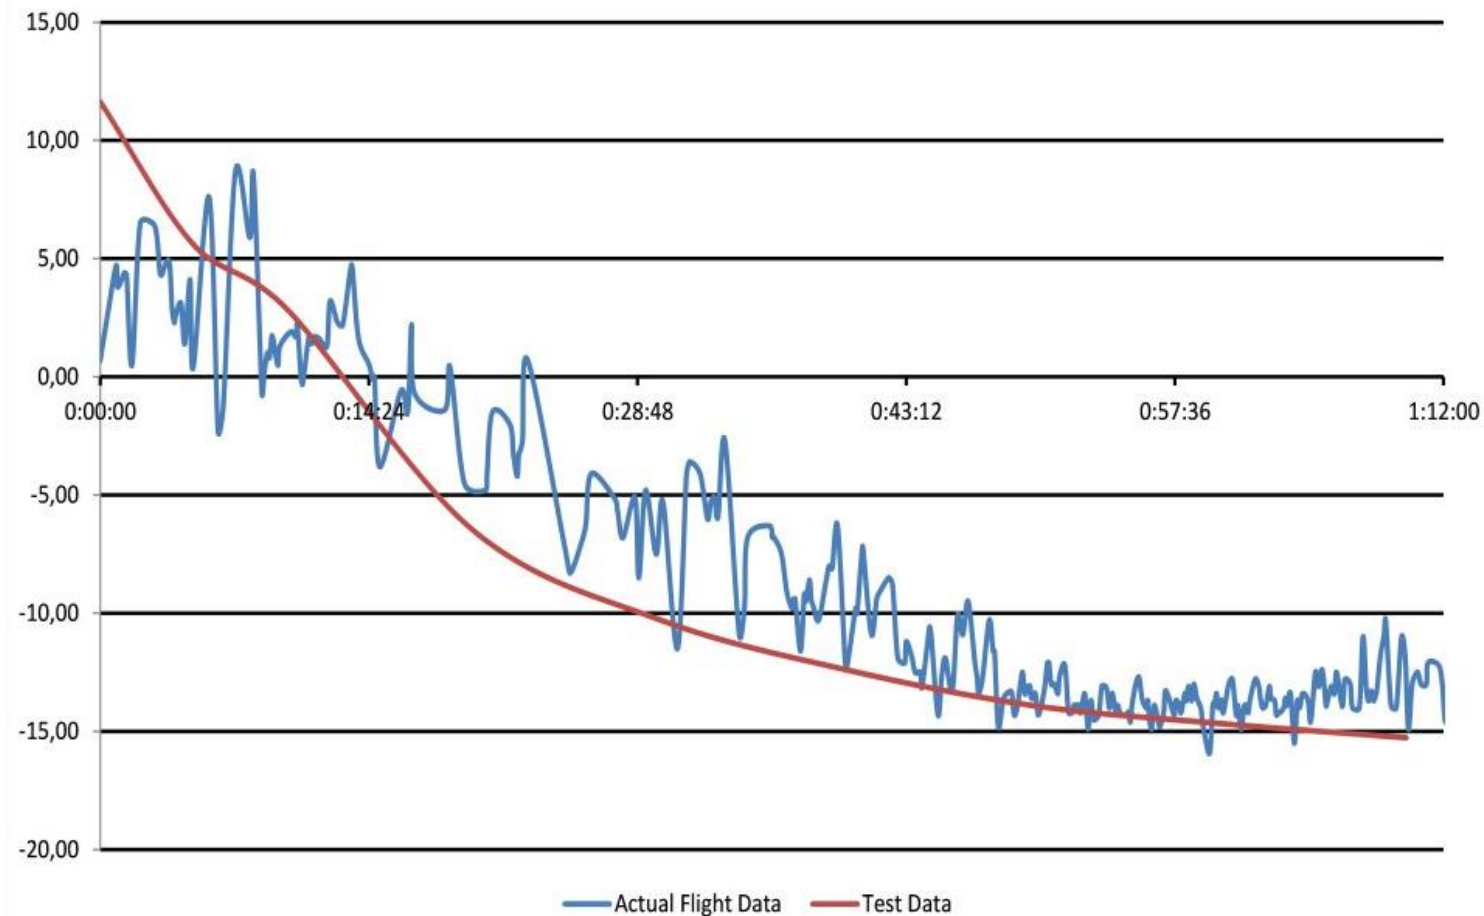

Figure 4 OBC Temperature: Collected vs. Test Data

- Collected OBC temperature data matched the Thermal Chamber test data
- Dispersion of the collected data is due to the properties of the internal sensor of the MCU and the period of the measurement
- COM module temperature data was not useful, temperature sensor recalibration is needed

4.5 Vertical speed

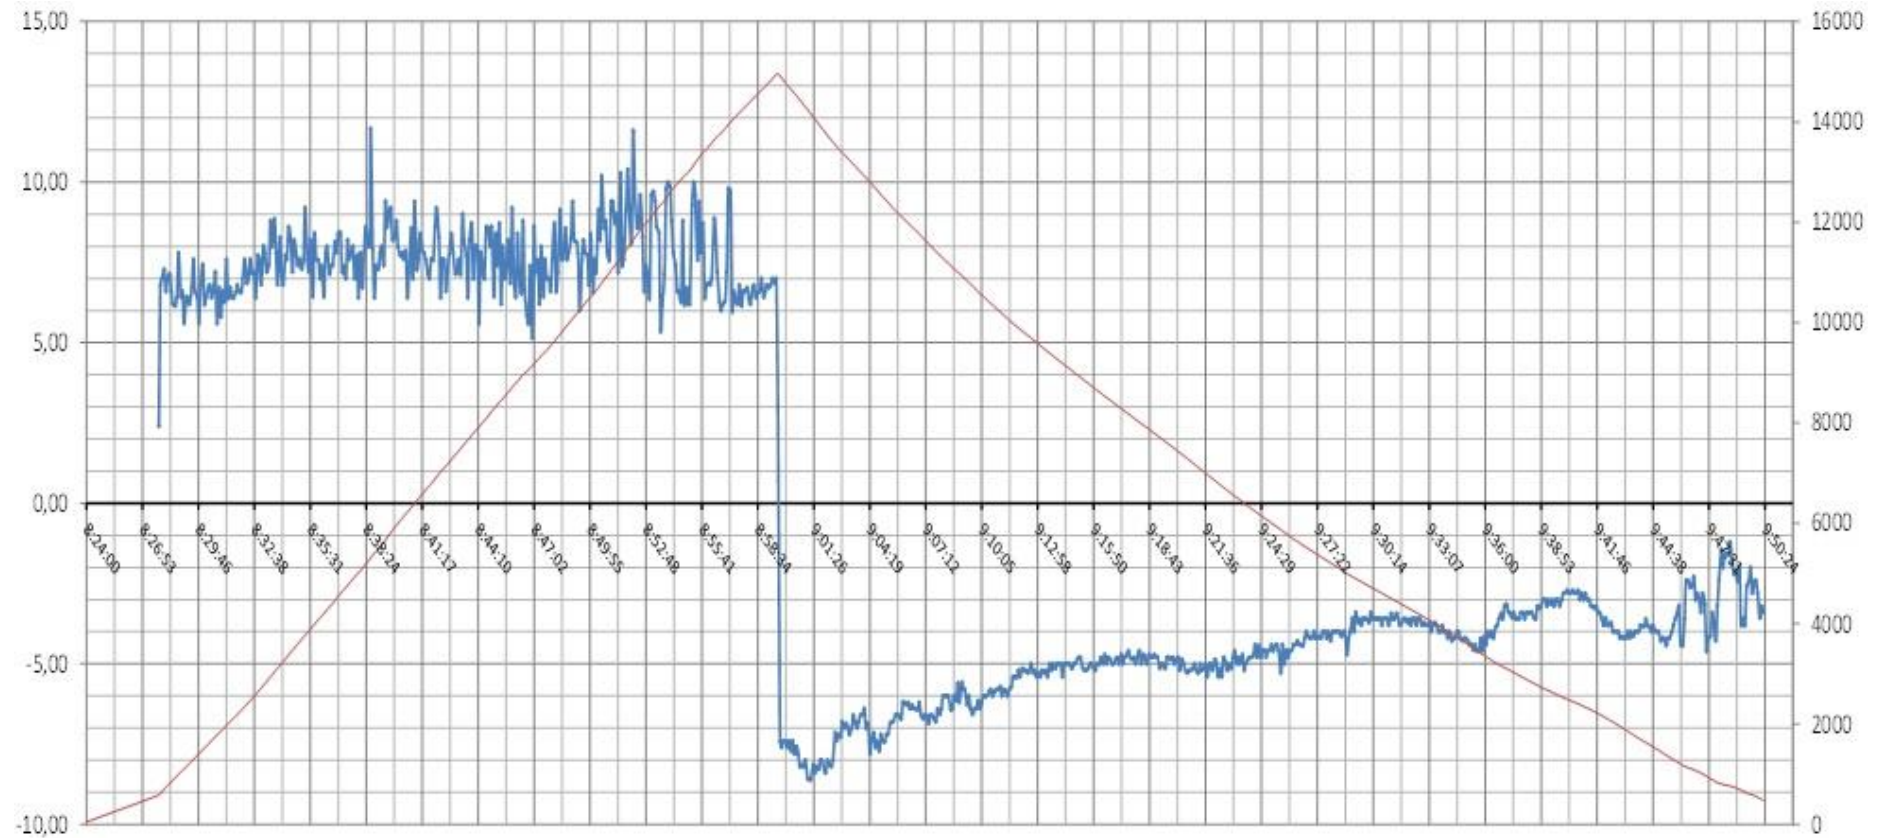

Figure 5 Vertical speed

- Dispersion of the ascend speed is due to airflow effects in the Troposphere. This effect ceased as the balloon reached the depth of the Tropopause
- Surface wind effects increased as the balloon returned below 2km altitude

4.5.1 Descend analysis

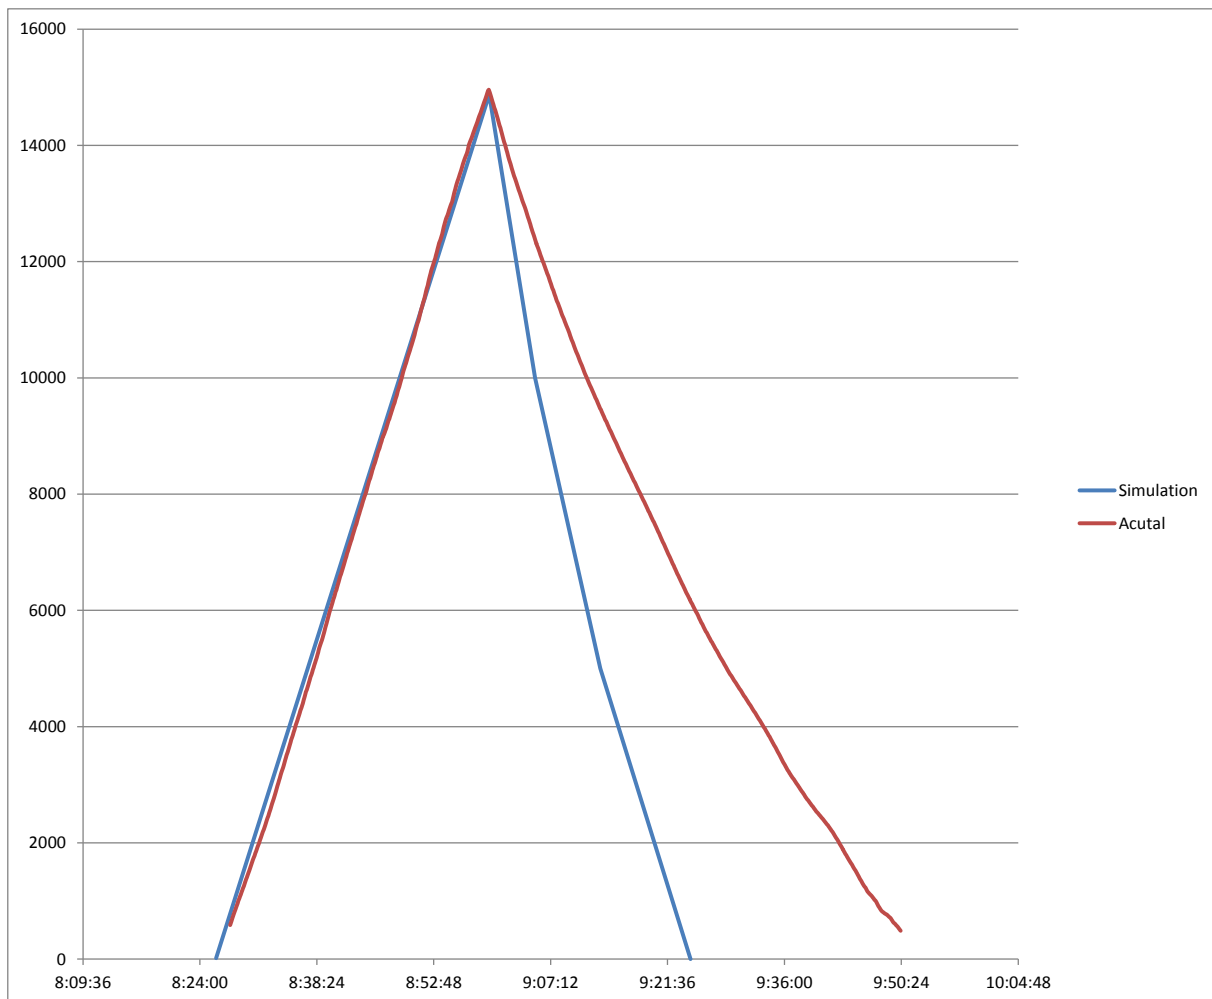

Figure 6 Simulated and Actual data with original pre-flight simulation data

Parachute properties (datasheet)		
Parachute mass	187	g
Parachute canopy cut construction	Flat circular	
Parachute diameter	0.9	m
Parachute drag coefficient (Cd)	0.6	-

Table 8 Parachute factory data

- For the original simulation the parachute datasheet given values were used
- The parachute diameter in the datasheet is referred to the inflated canopy section diameter, but the simulator uses the flat canopy diameter. This led to a significant calculation error in descent simulation.

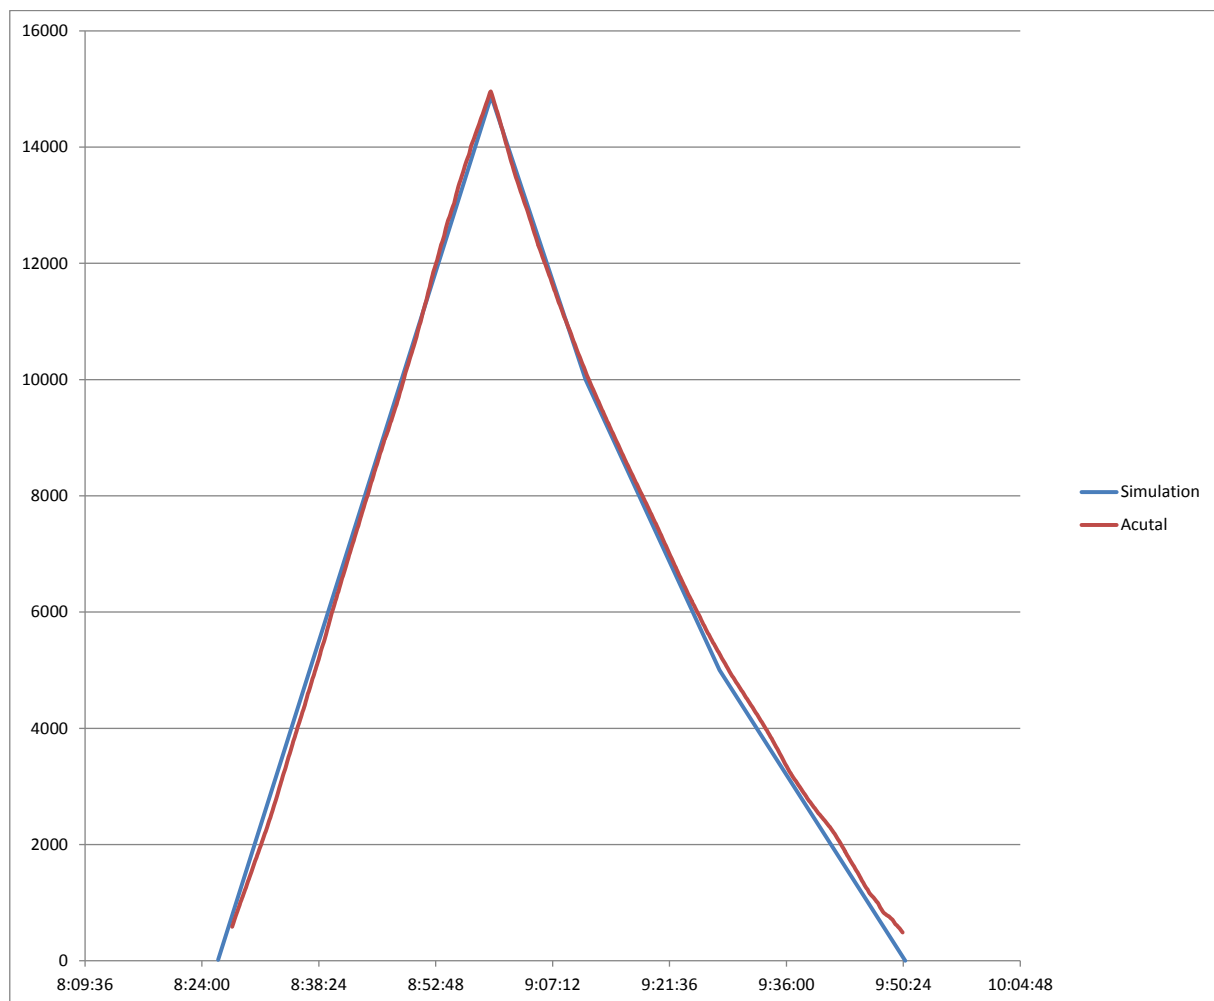

Figure 7 Simulated and Actual data with measured parachute properties

Parachute properties (measured)		
Parachute mass	187	g
Parachute canopy cut construction	Sectioned octagon	
Parachute flat diameter (circular equivalent)	1.85	m
Parachute drag coefficient (Cd)	0.6	-

Table 9 Parachute measured properties

- The significant simulation error suggested that the parachute properties should be measured
- In the post-flight simulations a (circular equivalent) flat diameter was used that was calculated from the actual measured parameters of the parachute
- The parachute has a special canopy construction based on a flat squared shape and inflated in a sectioned octagon shape. This parachute model should be added to the simulation for better results

4.6 Radio Signal

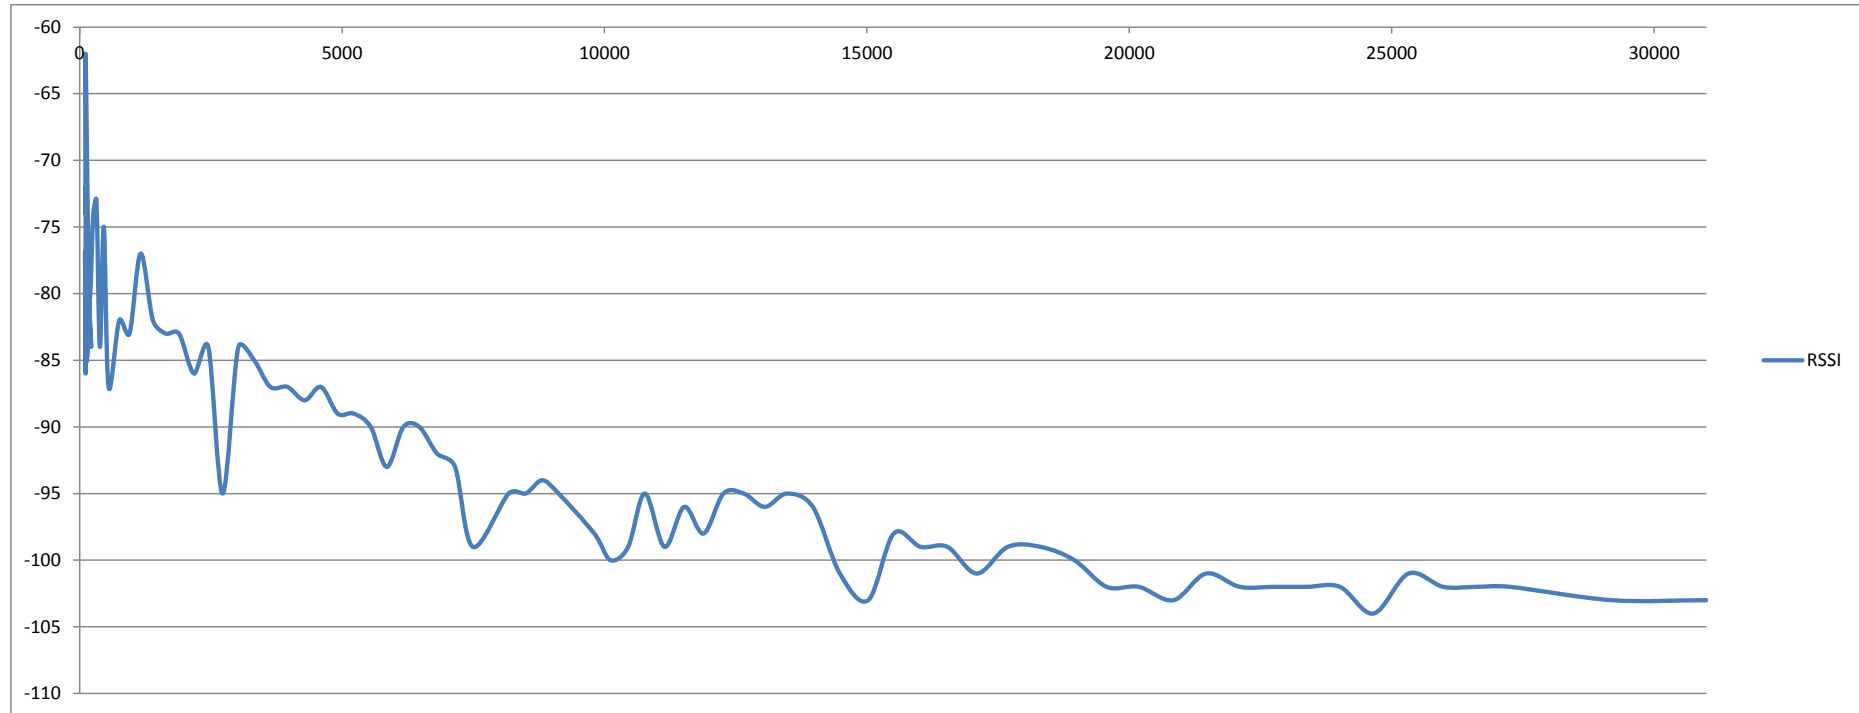

Figure 8 Radio Signal Strength vs. Balloon distance

4.7 Recovery

Figure 9 Landing site

- Recovered device was in good health, still operational, sound beacon was activated and noticed
- No damage was found neither on the capsule nor on the flight computer after inspection
- The parachute was intact. No damage was caused by the tree landing
- All element of the payload train declared reusable with minor maintenance for the next flight

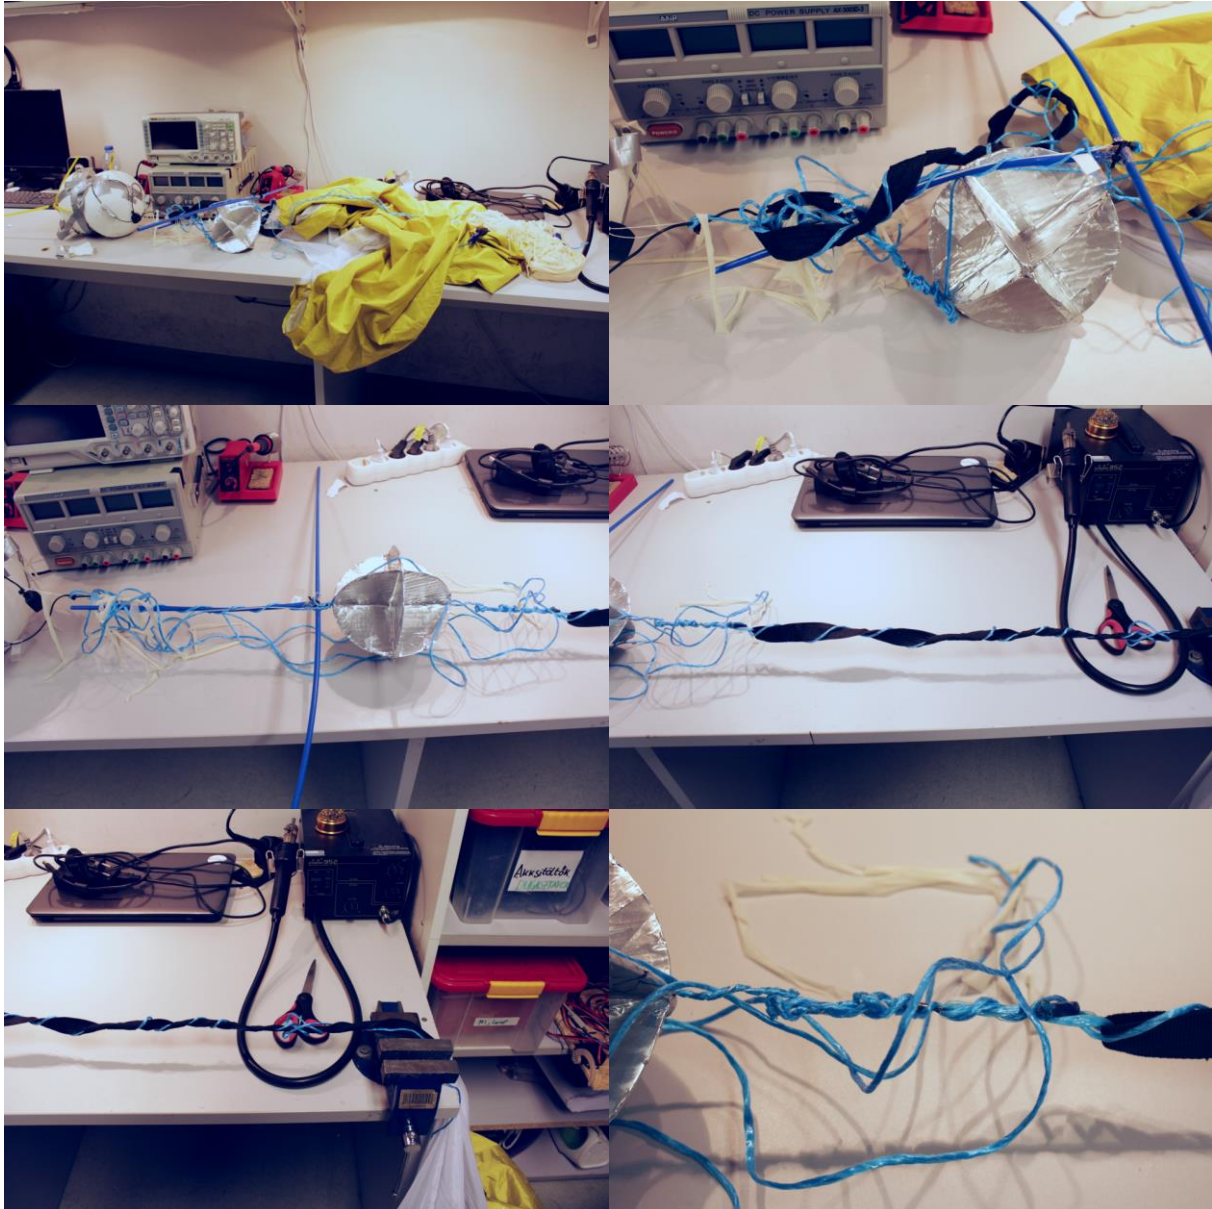

Figure 10 Recovered payload train and tangled balloon cord

- It was clear at the landing site that the cord connected the balloon and the parachute was completely tangled around the payload train
- The parachute construction prevented the cord to tangle on the parachute canopy so it could be fully inflated during descent
- The remains of the balloon was not tangled on the payload train but hanged under the main capsule. This could cause a 'sail-effect' which could lead to elongated horizontal travel distance in windy conditions (see 5.3 Descent Simulation and dealing with balloon remains)

5 Lessons Learned

5.1 Integration

- installation of empty SD-Card should be added to checklist
 - (in this flight we didn't format the card prior integration, but storage wasn't run out)
 - (added as a note, final integration manual will be updated after MATeF-3)

5.2 Radio Link and Ground Station

Better placement of the primary antenna should be considered for better line of sight

5.2.1 UHF Link

- GND HW configuration should be checked (weak signal processing)
- RSSI Threshold should be adjusted (**DONE**)
- MAX power output should be set and measured on COM-HW (**DONE: +18dBm**)
- consider better antenna for control radio (DVB-T + SDRSharp) (**CONCLUSIONS AFTER MATeF-3**)

5.2.2 APRS

- altitude data should be added (**DONE**)
- change SSID to 11 (balloon and aircraft) (**DONE**)
- APRS data should also be added to GND-SW for proper antenna rotation
- Additional data should be considered in APRS messages

5.3 Descent Simulation and dealing with balloon remains

- New parachute model should be added to the simulator based on the post-flight measurements of the parachute.
- Due to the windy weather and the 'sail-effect' of the balloon remains the horizontal travel distance was increased
- Methods to eliminate the 'sail-effect' should be considered
 - Shorten balloon cord length (9m was used for this flight)
 - Cut off balloon remains after burst

5.4 On-Board Data Logging

- initialization altitude should be changed to 0m (**DONE**)
- COM temperature sensor should be recalibrated
- on board logging stops at landing mode
 - Should be continued? (**YES**)
 - Stop condition? (**NO**)
 - storage space issues (**NO ISSUES WITHOUT ICS**)

5.5 External Temperature Sensor Placement

- Ext.Temp sensor configuration caused a self-heating effect
 - Sensor boom caused green-house effect on sensor
 - Sensor boom acted as a chimney for internal warmer airflow
- Sensor boom configuration should be reconsidered

5.6 Recovery

- Recovery team should take off as soon as possible after launch
- Recovery team must have the circuit breaker pins to shut down all the devices
